

Dear Members of the European Parliament,

The energy landscape, in particular electricity, is changing. It is increasingly flexible and more diverse, and integrates a growing share of renewable energy. Cleaner alternatives to highly polluting power generation must be at the centre of the energy transition to turn commitments into results.

Today, even the most polluting power plants can benefit from capacity remuneration mechanisms. Europe can build a cleaner future for its citizens – but only with the right electricity market design.

As the vote in the ITRE committee approaches, we call on you to act consistently and endorse the proposal to limit access to capacity mechanisms to plants emitting 550g CO₂/kWh or less as a way of ensuring a cleaner power supply for all Europeans.

To make a difference, the 550g carbon criterion should enter into force as quickly as possible, for all power plants, and cover the widest possible scope. Limiting exceptions and insisting on a rapid implementation is the best way to ensure Europe meets its ambitious climate objectives, unlocking the potential of cleaner energy supply and promoting renewables' growth.

The European Parliament can be once again the voice of ambition and leadership by defending the right of European citizens to have energy policies that work towards our climate goals.

#Support 550 #MakePowerClean

***Make Power Clean** is a campaign that brings together companies and associations focused on ensuring that Europe's future power market is consistent with the EU climate commitments and will provide cleaner energy for all.*
